ABSTRACT

This study aims to explore factors influencing on purchase intentions of life insurance policies among MBA students at the University of Co-operative and Management, Sagaing. Specifically, it emphasized five dimensions of factors influencing purchase intentions: income level, attitude, financial literacy, product awareness, and customer trust on purchase intention. The systematic sampling method was used to collect the required data. Firstly, using the Google survey form, 154 respondents were collected who are attending the MBA program at the University of Co-operative and Management, Sagaing. Secondary data were collected from textbooks, previous research papers, various publications, and credible online sources. The data were analyzed using SPSS version 26, including descriptive statistics, reliability testing, Pearson correlation analysis, and multiple regression analysis. According to the correlation analysis and multiple regression analysis results, all of the independent variables are positively related, and income level, attitude, and customer trust have a significant effect on buying intention. Finally, companies should focus on their customers' income level and provide positive attitudes toward life insurance policies. And then, improving product awareness through social media, clear policy explanations, and personalized communication can increase buyer intention. Customer trust is the essential main role for buying intention in this study. Finally, if the organizations are focusing on these factors, they can encourage more customers to buy life insurance policies and succeed in their organization, and it can help the country's economy growth.

ACKNOWLEDGEMENTS

First and foremost, I would like to express my deepest gratitude to Professor Dr. Moe Moe Yee, Rector of the University of Co-operative and Management, Sagaing (UCMS), for her unwavering support, encouragement, and guidance throughout my academic journey.

In addition, I am profoundly grateful thanks to Dr. Daw Tin Hla, DBA Programme Leader of Myanmar Imperial College Partnership with The Great Manchester University and Visiting Professor of University of Co-operative and Management (Sagaing), and Daw Khin Aye Myint, Retired Professor, Department of Statistics at the University of Co-operative and Management, Sagaing, for their invaluable advice, encouragement, and support, which greatly contributed to the success of this study.

I am specially thanks to Professor Dr. Wint War Khin, Program Director and Head of the Department of Management Studies at the University of Co-operative and Management, Sagaing, for her insightful guidance, and continuous encouragement throughout the research process.

Then, I am deeply indebted to my supervisor, Daw Win Myat Thuzar, Lecturer at the Department of Commerce, University of Co-operative and Management, Sagaing, for her valuable advices, encouragements and credible ideas and valuable knowledge throughout the duration of my thesis to complete this paper successfully completion.

Especially, I am extremely grateful to all people who supported me in collecting data and analyzing the factors until the completion of this study. I would like to thanks to all my teachers and the board of examiners for their valuable suggestion.

Lastly, I would particularly like to thank my friends, colleagues, and everyone who supported me directly or indirectly throughout this journey in overcoming challenges and achieving the successful completion of this study. My appreciation goes to all the respondents who were involved in the study of the survey, as they spent their precious and valuable time responding to the questionnaires, which provided me with vital information that I needed for this research.

CHAPTER I

INTRODUCTION

Most individuals now know about life insurance and regard it as part of a financial strategy. The insurer agrees to pay a beneficiary an amount of money following the death of an insured individual in a life insurance policy. Tax benefits come with life insurance. Insurance mitigates losses, stabilizes finances, and encourages trade and commerce for sustainable economic growth. Thus, insurance is essential to economic prosperity. Insurance sells and services "Insurance Contracts" to safeguard the insured's life and property from prospective loss or harm. Contractual or unanticipated benefits and indemnities for financial loss or damage will be compensated. There is no universal insurance definition. Some fundamental features of risk transfer or spreading are consistent across definitions.

Insurance is an arrangement whereby you pay a business money and they cover your expenses in the event of an accident, injury, etc. According to Williams (1997), Insurance is a process that combines the risks of more than one person or business by making actual or projected payments to a fund that is used to pay claimants. Life insurance is a significant financial instrument is life insurance for allocating funds in consideration of life's risks and is an essential component of long-term financial planning (Ajzen, 2006).

Life requires protection against uncertainty. The growing Asia-Pacific nations use insurance's benefits to grow economically (Rahman, 2019). Life insurance products are diversifying to meet insurance firms' consumption, savings, and risk management goals while maintaining their core qualities. Marco (2008) found that life and non-life insurance boost economic growth. Life insurance is important, as is understanding customer interests and how to engage them to secure insurance payments and economic growth in the insurance business. The cultural, social, political, and economic disparities between nations make it impossible to apply life insurance purchase intention studies globally. Since intentions drive most human action, understanding consumer intentions is crucial (Godin, 1994). Thus, policymakers must be more consumer-focused and understand factors of life insurance purchase intention. All businesses must understand this principle, but life insurance companies are shaped by their customers and so prioritize their opinions.

By understanding these attitudes, life insurance firms can maintain their market leadership. By understanding consumer requirements and expectations, insurance firms may improve their goods and services. In July 2023, Myanmar's insurance industry had 24 private enterprises, 1 SOE, 5 foreign-owned life insurers, and 6 joint ventures. Any foreign firm can be a licensed insurance business in the nation. Myanmar's 25 insurance firms form the crucial Myanmar Insurance Association. The industry is regulated by the Ministry of Planning and Finance's FRD and IBRB. This study examines how Theory of Reasoned Action (TRA) factors impact UCMS MBA students' life insurance policy purchases.

1.1 Rationale of the Study

The insurance business is growing and vital to the economy. Insurance products reduce individual and organizational risks and losses. Myanmar Insurance Enterprise (MIE), a government-run firm, dominated the insurance industry until 2013. The Myanmar government began financial and insurance reforms in 2013. The private sector received 12 insurance licenses and foreign businesses were allowed to open representative offices (ROs) after the insurance sector reform. That began the insurance sector's reform (Maung Maung Thein, 2020). International insurers focus on Southeast Asia's burgeoning life insurance markets. Myanmar becomes a promising life insurance market.

The Ministry of Planning and Finance (MOPF) declared in 2019 that international life insurance firms operated through completely owned subsidiaries and life, and non-life sectors created joint ventures with local enterprises to execute insurance services in Myanmar. The insurance regulator should oversee, regulate, and promote Myanmar's insurance market to expand companies. Myanmar's financial services industry is increasingly insuring freight, property, death, motor accidents, and medical expenses.

The people of Myanmar know that unpredictability, uncontrollable occurrences, and human mistake may cause losses. Personal or corporate insurance can reduce these losses (Khang, 2022). The Myanmar insurance business has struggled owing to low consumer knowledge, low cost-effectiveness, delayed customer service, and a lack of adequate products. Life insurance firms must understand client buying habits. Myanmar's economy is growing, and insurance services are vital to risk management. Companies and individuals are beginning to

recognize insurance. Insurance is more understood by consumers nowadays. They want insurance providers to offer better and more flexible services.

Consumers examine service quality, package differences, premium payments, compensation policies, and other perks before buying. Cultural, social, emotional, and psychological variables also influence their buying decisions. Insurance companies that address these criteria and satisfy client expectations are more likely to prosper in the competitive insurance market (Mon,2023). This study aims to uncover factors impacting life insurance policy purchase intentions among UCMS MBA students and investigate individual life insurance product purchases. The findings should help Myanmar's life insurers understand customer purchases. The study also examines how money moderates' relational elements affecting Myanmar life insurance client buying decisions.

1.2 Problem Statement of the Study

The insurance industry in Myanmar, especially life insurance, is facing some big changes thanks to government reforms and the growing importance of insurance as an effective risk management tool. However, despite this growth and the increasing potential of Myanmar's life insurance market, there are many challenges ahead, especially concerning understanding the construct of consumer purchase intention. Myanmar's economy is developing rapidly, so the needs for insurance services will increase, but it depends on consumers' awareness, attitude and behavior toward life insurance products.

The life insurance respond needs to understand the varying and complex drivers of consumers' decision-making processes in Myanmar. 29% of consumers are concerned about the lack of suitable and economical life insurance products that would meet their needs and fit their budgets. Myanmar consumers are bound by their emotional warmth, giving the impression of being constrained by data, yet it does find a warm niche in the market.

The importance of life insurance might not be lost on lower-income people, but when up against rent and groceries, life insurance can all too quickly be pushed down the priority straight. Hence, for the insurers to make affordable and accessible products, it is imperative to analyze how income levels affect consumer purchasing. This research will delve into how people arrive at these decisions, assessing how

their personal decision-making processes, including psychological, cultural, and social factors, influence their attitudes toward life insurance.

Moreover, the relationship between all above factors and the intention to purchase life insurance will also be examined through the prism of income in this study. This study aims to fill these gaps in order to generate insights that can assist life insurers to better understand consumer behaviors, improve their product pyramids, and target the right type of segments to increase life insurance penetration, especially in Myanmar.

1.3 Research Questions

1. How do determine the important factors of influencing on purchase intentions of life insurance policy in among MBA students of UCMS
2. How to examine the relationship between factors and purchase intentions of life insurance policy in among MBA students of UCMS

1.4 Objectives of the Study

The objectives of the study are:

1. To determine the important factors of influencing on purchase intentions of life insurance policy in among MBA students of UCMS.
2. To examine the relationship between factors and purchase intentions of life insurance policy in among MBA students of UCMS.

1.5 Hypothesis of the study

The following hypothesis can be presented for this research as follow;

- H₁: Income Level has a positive effect on purchase intentions of life insurance policy in among MBA students of UCMS.
- H₂: Attitude has a positive effect on purchase intentions of life insurance policy in among MBA students of UCMS.
- H₃: Financial Literacy has a positive effect on purchase intentions of life insurance policy in among MBA students of UCMS.
- H₄: Product Awareness has a positive effect on purchase intentions of life insurance policy in among MBA students of UCMS.
- H₅: Customer Trust has a positive effect on purchase intentions of life insurance policy in among MBA students of UCMS.

1.6 Method of Study

This study examined factors affecting life insurance purchase intentions among UCMS MBA students. This study uses primary and secondary data to achieve its goals. Respondents received the structural questionnaire with seven-point Likert scale items for primary data. To assure sample accuracy and representativeness, the Taro Yamane (1967) formula will be used with a 5% margin of error and 95% confidence interval. About 250 MBA students attend University of Co-operative and Management, Sagaing. Participants were chosen using stratified random selection. Over time, researchers collected secondary data from pertinent texts, journal articles, internet domains, and research papers. The study's objectives were proven using descriptive statistics, correlation, reliability, and multiple regression. The study employed descriptive statistics to analyze respondents' personal data and generate means and SD for dependent and independent variables. Analysis of variables' direction and degree of association and purchase intention factor was done using correlation and multiple regression analysis.

1.7 Scope and Limitations of the Study

This study examines the factors affecting life insurance policy purchase intention among UCMS MBA students. The survey sampled 250 MBA students. This research excludes HRD students except MBA students. There are many students in UCMS. Among them, MBA students were selected according to their size and complexity.

1.8 Background of the Study

Over the years, economic and legal changes have caused a dramatic transition in Myanmar's insurance sector. In 1826, European insurers started offering their services to the expatriate population, marking the beginning of the sector. In addition to two domestic companies, Myanmar welcomed more than 100 foreign insurers after winning independence in 1948. One of these, Burma National Insurance, was renamed the Union Insurance Board after being nationalized in 1952.

All foreign insurance businesses were seized in 1963, and the State-Owned Economic Enterprises Law allowed the state to monopolies the industry by 1989. But things changed after the 1993 Myanmar Insurance Law, which made Myanmar Insurance a state-owned company. The Insurance Business Regulatory Board (IBRB)

was established in 2014, and in 2020, private insurers were permitted to write the majority of non-life policies and conduct reinsurance programs as part of additional reforms meant to modernize the industry.

The insurance market in Myanmar today consists of both life and non-life segments, providing a wide range of products to both individuals and businesses, especially those in industries like construction and agriculture. In order to promote market liberalization and enhance consumer protection, the regulatory framework has been revised. The establishment of offices in Myanmar by foreign brokers and insurers has contributed to the modernization of the sector.

Regardless challenges like inadequate infrastructure and low insurance penetration, the sector continues to expand thanks to continuous reforms, international partnerships, and public education initiatives. Myanmar's insurance market is expected to continue growing thanks to a supportive regulatory framework and growing demand as the nation's economy develops.

Myanmar has 17 life insurers. Myanmar Insurance is the sole state-owned insurer. The life insurance category has 8 domestic, 3 joint venture, and 5 overseas businesses. Myanmar Insurance Enterprise (MIE), Local Private Life Insurance Companies, Wholly Foreign-Owned Life Insurance Companies, and Life Insurance Joint Ventures offer life insurance. Myanma Insurance, a state-owned company created in 1952, originally offered life insurance before expanding into non-life. It provides general insurance and life assurance from 39 sites nationwide, with its headquarters in Yangon. The corporation has a Life Fund of 26,130.91 million, a General Fund of 164,694.67 million, and a General Reserve Fund of 15,388.48 million. It enjoys government support, is sheltered from liquidation, and settled Kyats 4,788.25 million in 2018 and 2019. Foreign investors must obtain Myanma Insurance by legislation. The first phase of private local company licensing began the market shift in 2012. Private life insurers must have MMK 6 billion (\$5.4 million) in paid-up capital, non-life MMK 40 billion (\$36 million), and composite MMK 46 billion (\$41.4 million). This must be deposited at Myanmar Economic Bank 10% and invested in government securities 30%.

Five international life insurance providers were authorized to conduct business in Myanmar as fully-owned subsidiaries on April 5, 2019. These businesses are Prudential Myanmar Life Insurance, Manulife Myanmar Life Insurance, Dai-ichi Life Insurance Myanmar, Chubb Life Insurance Myanmar, and AIA Myanmar Life

Insurance. It is anticipated that the arrival of these international insurers will boost competition and accelerate local market growth.

Three foreign-Myanmar joint ventures received life insurance business licenses on July 31, 2019: Grand Guardian Life Insurance Company teamed up with Nippon Life Insurance, Citizen Business Insurance teamed up with Thai Life Insurance, and Capital Life Insurance partnered with Taiyo Life Insurance Company. With foreign equity restricted to 35%, there might be room for more collaborations in joint ventures involving life and non-life insurance.

In Myanmar, the life insurance organization such as private and public organization are continuity growing, with increasing efforts to raise awareness about the importance and benefits of life insurance products. Awareness operation emphasizes financial security, risk protection, and long-term savings. However, product knowledge among the general population remains limited due to low financial literacy and lack of trust in insurance providers. Awareness was low due to limited financial literacy and unfamiliarity with insurance concepts. Insurance companies increased efforts to educate potential customers through awareness campaigns, community outreach, and media promotions, which helped improve understanding of life insurance benefits and importance.

1.9 Organization of the Study

This research has five chapters. Chapter I introduces the study's premise, problem description, objectives, methodologies, scope, limits, and organization. Chapter II reviews literature on life insurance policy buying intentions and past investigations. We show the study's conceptual framework using theories and past research. Chapter III describes the study's approach. Data analysis of life insurance purchasing intentions appears in Chapter IV. Chapter V covers findings, debate, recommendations, study implications, and future research.

CHAPTER II

LITERATURE REVIEW

This chapter reviews study-related literature and background theory. Also addressed is the link between life insurance policy purchasing intentions and the study's conceptual framework. TRA and insurance are explained. Previous research on life insurance purchasing intentions is also reviewed in the chapter. After reviewing the literature, the study's conceptual framework is created.

2.1 Behavioral Models

These include studies that predicted life insurance purchases using theory of reasoned action and theory of planned behavior.

2.1.1 Theory of Reasoned Action (TRA)

The theory of reasoned action (TRA) by Fishbein and Ajzen (1975) is terms as those specific intentions to behave are that contribute to that behavior. The theory states that intention is the primary factor that determines actions. There are two main factors to determine the behavioral intentions, which are personal in nature and the second one is influence of social reflects. Authors were preferring hierarchy for the theory of reasoned action and attitude; subjective norms and perceived behavior are influence to intention.

Ogenyi Ejye & Owusu-Frimpong (2007) anticipate life insurance purchase behaviors by intent to act and assess the TRA model in the insurance company. Behavior intention reflects subjective standards, social influence, and attitude. The Theory of Reasoned Action (TRA) can explain purposeful and rational financial decision-making. According to Bagozzi (1982), the Theory of Reasoned Action (TRA) is an intuitive and perceptive paradigm that may explain behavior. The Theory of Reasoned Action (TRA) has been used to describe planned and rational financial decision-making.

2.1.2 Theory of Planned Behavior (TPB)

Ajzen (1985) states that Planned Behavior Theory (TPB) emphasizes psychological control, which might affect purchase decisions. Behavioral economics,

particularly buying behavior theory, has improved our knowledge of product purchase decisions (Khaing, 2023). According to the Theory of Planned conduct (TPB), intentions are impacted by information, beliefs, and positive and negative attitudes about the conduct. Researching market trends and consumer happiness is essential to economic growth, but it must be founded on a significant decision about client purchase. The hypothesis indicates two primary implications of behavioral control perception: The more control we feel we have over our conduct, the stronger our intention to partake in it. Second, it affects our behavior. We work harder and endure longer if we feel in control. The current notion of perceived behavioral control is similar to perceived self-efficacy, which is an individual's assessment of their capacity to handle future events.

2.2 Factors Influencing of Purchase Intentions

Many researchers have been studied the factors influencing on purchase intentions of life insurance. In this study, income level, subjective norms, financial literacy, product awareness and customer Trust.

2.2.1 Income Level

Consumer market demographics include income. Consumer decision-making patterns are influenced by demographic parameters such as age, gender, and wealth (Kamaruddin,2023). Income traffic is a key demographic element that influences product commitment, brand loyalty, and consumer behavior. This has consequences for marketing strategies such as segmentation, targeting, and positioning (Suvadarshini & Mishra, 2021).

2.2.2 Subjective Norm

According to Su (2023), a subjective norm in social psychology refers to the felt social pressure or expectation of a person to execute a specific action. According to Ajzen (1991), subjective norms refer to perceived social pressure that influences conduct. Numerous studies indicate that subjective standards have a smaller impact on intention than attitude. The individual believes that most influential people believe they should not engage in the action.

2.2.3 Financial Literacy

Financial decision making involves understanding money. (Ramlee, 2019; Lusardi, 2010). Mahdzan and Victorian (2013) define financial literacy as the capacity to manage and preserve savings, enabling them to accumulate wealth and redistribute it later in life. Lusardi, Mitchell, and Curto (2010) found that financially illiterate individuals had lower savings rates and retirement savings, but financial literacy improves financial decision-making.

2.2.4 Product Awareness

Brand awareness is a term of marketing for the extent to which consumers identify a product by its name (Kopp, 2024). Brand awareness can also reflect of excellence and commitment that affect consumers get to know a brand permitting to worry at the time of purchase (Tang & Hawley, 2009). Customer will have a higher purchase intention with a familiar product (Kamins & marks,1991) Customers are more likely to take a well-known and recognizable brand consideration when making a buying choice. So, product awareness is the key factor of purchasing intention.

2.2.5 Customer Trust

Trust is a critical tool for the success of every organization. It has been difficult to set up customer's trust by the provision of quality service, especially insurance companies (Eid,2013). Trust is built through practical interactions with others. Insurance industries will reap the benefits of firmly the intention to buy with trust and better quality of service to customers. (Ling, Chai, & Piew, 2010). The study of Upadhyaya and Badlani (2011) trust is the main source to determine the success of insurers.

2.3 Purchase Intention

Purchase intention means chance for purchase; it is connected to a true desire to purchase the product. (Halim & Hamed, 2005; Kincaid, 2003). A tendency of consumers to take-action before making a purchase decision for a certain product is known as buy intention (Schiffman & Kanuk, 2000). Positive purchase intention typically leads to higher sales and reduced consumer costs, but it requires a lot of marketing work (Palmatier, Scheer, & Steenkamp, 2007). For marketers to forecast and track customer purchasing patterns, purchase intentions are crucial. If a consumer

has a strong motivated goal, they are more likely to act later on, like buying a product. (Ajzen, 1991, Morwitz, 2012).

Purchase intention is linked to customer behavior, perceptions, and attitudes due to the complexity of the purchase decision process. Since its creation in 1968, the Engel-Blackwell-Miniard Model (consumer decision model) has undergone several updates and alterations. According to EBM model, individual characteristics, contextual circumstances, and psychological processes affect decision-making, (Blackwell, Miniard & Engel, 2001).

2.4 Previous Study

Previous studies examined life insurance buying decisions. This chapter reviews life insurance policyholder purchasing intention theories and ideas. After reviewing the literature, the study's conceptual framework is created.

Bista, and Upadhyay, (2023) examined Chitwan customers' life insurance policy purchase decisions. In their study, purpose of buying, perception and appraisal options, and trust were independent factors, while life insurance policy purchase was the dependent variable. Analytical cross-sectional research was done on 150 insurance holders in Bharatpur, Chitwan, Nepal. Data was analyzed using descriptive and inferential statistical methods. Statically significant correlation coefficients exist between independent variables influencing life insurance policy purchases and dependent variables. Next, Zakaria, Z.et al. (2016) study Intention to Purchase Life Insurance: A Case Study of Public University Staff. Financial Literacy, Saving Motives, and Religion were independent factors. Purchase decisions are dependent. Multiple regression and correlation were used to examine data. This study found all independent factors significantly affect buying intention.

2.5 Conceptual Framework of the Study

The study examines factors affecting life insurance policy purchase intentions among MBA students at University of Cooperative and Management, Sagaing. The following conceptual model was constructed for this study based on past research. Study conceptual framework is shown in Figure 2.1.

Source: Own Compilation, 2025

Figure 2.1 Conceptual Framework of the Study

This study explores factors impacting life insurance policy purchase intentions among MBA graduates of University of Co-operative and Management, Sagaing. Figure 2.1. Five independent variables are identified using the Behavior Model, Theory of Reasoned Action (TRA), and Theory of Planned Behavior (TPB). Income, subjective standards, financial literacy, product knowledge, and customer trust are independent factors.

CHAPTER III

RESEARCH METHODOLOGY

This research is examined data collection strategy and methods. The research design, data collection, target population, sample strategy, data analysis, and measurement items are extensively explained.

3.1 Research Design

This study examines factors affecting life insurance policy purchase intentions among MBA students at University of Co-operative and Management, Sagaing. The research design provides a study framework. The research design plan guides a research effort from its inception to its data analysis (Jasen, 2023). MacMillan and Schumacher (2001) define research design as a strategy for selecting individuals, settings, and data collecting techniques to answer the study question. Research strategy selection is crucial to research design (Sileyew, 2019). Cooper (2014) lists four research methods: reporting, descriptive, explanatory, and predictive. This study employed descriptive methods. A descriptive study examines a topic by gathering data and categorizing research variable frequencies or interactions (Adera, 2018). This research is offered data mathematically and descriptively, following a quantitative methodology. The study uses numerical data to describe the variables' relationships. A survey will collect quantifiable data about respondents' experiences and satisfaction. Primary and secondary data are used to meet study goals.

3.2 Sampling Design

Sampling allows researchers to derive reliable conclusions about a target group by carefully picking items from the sample. Probability and non-probability sampling methods exist. Research study type determines sampling strategy. The researcher must choose a trustworthy and acceptable sample design. Probability sampling designs include basic, systematic, stratified, cluster, area, multi-stage, and sequential sampling. Convenience, judgment, and quota sampling are non-probability designs. Simple random, stratified, cluster, and systematic sampling are common. This study employed stratified sampling. Sample size is the number of respondents who are representative of the population under study and should be proportionate to

its size. The study sampled 250 people. Simple random, stratified, cluster, and systematic sampling are prevalent. Data surveys were used in this study. This study employed stratified sampling to estimate sample size.

This sample size is based on Yamane's (1967) Formula.

$$n = \frac{N}{1+N(e^2)}$$

$$n = \frac{250}{1+250(0.05^2)}$$

$$n = 154$$

Where,

n = the sample size

N = the size of population

e = the error of 5 percentage points

From 250 clients, Yamane's formula of sample size with an error of 5% and a confidence coefficient of 95% yields 154 clients.

Stratified random sampling, also known as proportionate or quota sampling, involves dividing the population into homogenous groups (strata) and undertaking sampling. For subgroup or stratum data analysis, researchers employ stratified random sampling. In a stratified sample, researchers divide a population into similar sub-populations, known as strata, depending on factors such as ethnicity, gender identity, and region. Every study participant should be in one stratum (Thomas, 2020). The best probability sampling strategy is stratified sampling, which assumes subgroups will have different mean values for the variables you analyze. Stratified random sampling is ideal when a population has heterogeneity that can be identified using auxiliary information. The more different the strata, the greater the accuracy. When studying group differences in a varied population, stratified sampling is best (Bisht, 2024). Each MBA batch's sample size is shown in the table below.

Table 2.1 Allocation Table of the Sample Size

Batch	Population (N _i)	Sample (n _i)
MBA 1 st batch	100	62
MBA 2 nd batch	150	92
Total Population	250	154

Source: Survey Data, 2025

3.3 Questionnaire Design

A questionnaire is important instrument for research, enabling the researcher to gather relevant data related to the study topic (Taherdoost,2022). Questions are the way researchers express the information they need for their study, which can be answered through the responses of the participants. Questionnaires are the main point of main technique of collecting primary and quantitative data. The proper design of the questionnaire can influence both the quality and quantity of the collected data, and ultimately, the outcomes of the survey (Taherdoost, 2022).

A questionnaire was utilized to gather data in this investigation. Interviews and focus groups take time and resources, but questionnaires allow researchers to obtain data from a wide sample at once. They are cost-effective for large-scale research (Jaon, 2023). This research uses three-part questions. The first portion collected respondent demographics. Questions covered gender, age, education, work experience, position, and income. The second section of the study examines factors affecting life insurance policy purchase intentions among MBA students at University of Co-operative and Management, Sagaing. Third, MBA students at University of Co-operative and Management, Sagaing prioritize life insurance policy purchases. Questions were on a seven-point Likert scale (1 = Strongly Disagree, 2 = Disagree, 3 = Partially Disagree, 4 = Neutral, 5 = Partially Agree, 6 = Agree, 7 = Strongly Agree. Secondary data comes from newspapers, periodicals, books, and the internet.

3.4 Research Framework

A systematic strategy for studying factors influencing life insurance policy purchase intentions among MBA students of University of Co-operative and Management, Sagaing. It provides a clear roadmap that connects the study's theoretical foundation to its practical execution, ensuring consistency and coherence throughout the research process.

Source: Own Compilation, 2025

Figure 3.1 The Study Framework

This study uses TBP and TRA Model. The research model was developed after a thorough literature study identified the key variables and formed the research hypothesis. The dependent variable was purchasing intention, evaluated by this questionnaire.

3.5 Data collection Method

Data is collected and measured methodically to answer research questions, test hypotheses, and evaluate outcomes (Kabir, 2016). There are two data collection methods. Gathering primary and secondary data. Original, unused info comes from

actual experience. Primary data collection produces accurate, research-specific data. Past data is secondary data. Organizational internal and external data sources might provide data for the researcher. The major strategy was used for this investigation because it efficiently collects statistical measurable data. UCMS MBA students receive questionnaires. Surveys using closed-ended questions collect primary data. Use of questionnaires for this study allows for cost-effective and quick data collection from a large number of respondents. Secondary data comes from past studies, literature, and the Internet.

3.6 Data Analysis

Data analysis uses statistical approaches to collect, clean, convert, summarize, analyze, and interpret data (Eldridge, 2024). Effective research results depend on data analysis. Multiple statistical methods were employed to assess questionnaire data. SPSS analyzes respondent data. This study used descriptive statistics, reliability, Pearson correlation, and multiple regression.

3.6.1 Descriptive Statistics

Statisticians use descriptive statistics to summarize and characterize data like total, mean, standard deviation, and others. Sugiyono (2004) defines descriptive analysis as a statistical method used to summarize data without drawing judgments or generalizations. Descriptive statistics includes mean, median, mode, SD, range, and variance. A bigger standard deviation (SD) implies that data points are widely distributed around the mean, whereas a smaller SD shows that most observations are near to the mean. This study calculates dependent and independent variable means and SD using descriptive statistics. The mean values measured the average reaction, whereas the SD measured variability.

3.6.2 Reliability Analysis

Sukardi (2007) defines reliability as a test's consistency in measuring the same object. Cronbach's alpha shows if the test measures the target variable. It assessed the questionnaire's multiple-item scales' internal consistency. Measurements taken to the same persons at different times and test item equivalence are measured for reliability (Kimberlin & Winterstein, 2008). A typical reliability metric is Cronbach's Alpha. Results consistency, stability, and reproducibility define quantitative research

dependability. We trust consistent outcomes in identical but varied circumstances. Qualitative research requires technique consistency between projects and researchers (Twycross & Shields, 2004). No reliability equals 0 and perfect dependability 1. Most dependable scales have coefficient alpha between 0.80 and 0.90. Scales with coefficient alpha 0.70–0.80 are dependable, whereas 0.60–0.70 are sufficient. A coefficient alpha between 0.50 and 0.60 indicates average reliability, whereas below 0.50 indicates poor reliability (Manerikar & Manerikar, 2012).

3.6.3 Correlation Analysis

Two or more variables are correlated in correlation analysis. Correlation coefficients quantify linear correlations between variables and range from -1 to +1. Measurement of correlation between independent variables (X) and dependent variables (Y) using the Pearson correlation coefficient is crucial (J. Benesty. et al., 2009).

Formula for Pearson's correlation coefficient

$$r = \frac{\sum(x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum(x_i - \bar{x})^2} \sqrt{\sum(y_i - \bar{y})^2}}$$

when

r = correlation coefficient

x_i = values of the x-variable in a sample

$\bar{x}$ = mean of the values of the x- variable

y_i = values of the y-variable in a sample

$\bar{y}$ = mean of the values of the y-variable

3.6.4 Multiple Regression Analysis

Multiple regression analysis is an excellent and extensively used statistical procedure, but it is also widely abused (Mendenhall, Sincich, 2003). To investigate the relationship between a dependent variable and a single independent variable, univariate regression aims to create a linear equation (Uyanık and Güler, 2013). The multiple regression model has one dependent variable and numerous independent variables (Tabachnick and Fidell, 1996). In this regression analysis, income level,

attitude, financial literacy, product awareness, and customer trust were independent variables while purchase intention was the dependent variable.

The estimated multiple regression model is

$$Y=f(X_1, X_2, X_3, X_4, X_5, \dots, X_n)$$

Where,

Y= the value of dependent variable

X = the value of independent variable

Multiple regression assumptions are crucial for reliable findings. The residuals' distribution in a normal probability plot confirms Assumption 1 that the independent and dependent variables should be linear. A P-P plot with the diagonal line indicating normality helps verify Assumption 2's residual distribution. Assumption 3 needs constant residual variance, therefore the error should be comparable at all sites. This may be checked by inspecting the residual scatter for randomness rather than a funnel shape. Assumption 4 requires that the independent variables are not significantly linked, which may be verified by checking correlation tables for values over 0.8 or computing VIFs below 10 and tolerance scores above 0.2.

CHAPTER IV

ANALYSIS OF FACTORS INFLUENCING ON PURCHASE INTENTIONS OF LIFE INSURANCE POLICY

This chapter discusses the employee profile and variables affecting life insurance purchase intentions among MBA students at University of Co-operative and Management, Sagaing. It also shows respondents' views on MBA students' five life insurance policy buying intents and their relationships.

4.1 Demographic Factors of Respondents

This section profiles 154 University of Co-operative and Management, Sagaing students. Demographic profile sub-sections include gender, age, marital status, education level, monthly income, occupation, and working experience.

4.1.1 Gender of Respondents

This research included male and female participants. Table 4.1 shows respondent gender percentages.

Table 4.1 Gender of Respondents

No.	Gender	Frequency	Percent
1	Male	39	25.3
2	Female	115	74.7
	Total	154	100

Source: Survey Data, 2025

As shown in Table 4.1, most of the respondents are female and it has 74.7% of the total respondents. The rest 25.3% of total respondents are male. So, female respondents are more than male respondents. According to the results, female are more interest to buy life insurance than male.

4.1.2 Age of Respondents

This section describes the gender of the respondents as percentage.

Table 4.2 Age of Respondents

No.	Age (Years)	No of Respondents	Percentage
1	Under 30	16	10.4
2	Between 31 to 35	27	17.5
3	Between 35 to 40	48	31.2
4	40 and above	63	40.9
Total		154	100

Source: Survey Data, 2025

Table 4.2 shows that 10.4% of respondents are under 30, 17.5% are 31 to 35, 31.2% are 35 to 40, and 40.9% are 40 and older. According to the data, most responders are 35–40 and 40+.

4.1.3 Marital Status of Respondents

The following Table is shown that the demographic information of gender segregation from the demographic data from the respondents.

Table 4.3 Marital Status of Respondents

No.	Marital Status	Frequency	Percent
1	Single	69	44.8
2	Married	85	55.2
	Total	154	100

Source: Survey Data, 2025

Respondents are single or married. In Table 4.3, 44.8% of respondents are single and 55.2% are married.

4.1.4 Education Level of Respondents

The survey divides respondents' schooling into three groups. These are graduates, Masters and other education level.

Table 4.4 Education Level of Respondents

No.	Education Level	Frequency	Percent
1	Graduate	74	48.0
2	Master	57	37.0
3	Other	23	15.0
	Total	154	100

Source: Survey Data, 2025

Table 4.4 shows that 48.1% of respondents are graduates, 37.2% are masters, and 14.7% are other degrees.

4.1.5 Monthly Income of Respondents

The following table shows respondents' monthly income. Monthly incomes of respondents are divided into four groups.

Table 4.5 Monthly Incomes of Respondents

Sr. No.	Position	No. of Respondents	Percentage
1	Less than 300,000	24	15.7
2	Between 300,000 to 500,000	3	1.9
3	Between 500,000 to 700,000	88	57.1
4	Above 700,000 to 900,000	39	25.3
	Total	154	100

Source: Survey Data, 2025

According to the table 4.5, the majority of respondents have an income level between 500,000 to 700,000 kyats. The second largest groups of respondents are those with 700,000 to 900,000 kyats. The minority of respondents are 300,000 to 500,000 kyats.

4.1.5 Position of Respondents

Table 4.6 presents the Position of the respondents are classified into four groups as follow.

Table 4.6 Occupation of Respondents

No.	Position	No. of Respondents	Percentage
1	Government	50	32.5
2	Private	50	32.5
3	Own	47	30.5
4	Other	7	4.5
	Total	154	100

Source: Survey Data, 2025

According to the table 4.6, a majority of respondents were private sector, the second largest group is government sector, and others are their own business and other occupations.

4.1.6 Working Experience of Respondents

Table 4.6 shows respondents' monthly income. Monthly incomes of respondents are divided into five groups.

Table 4.7 Working Experience of Respondents

No.	Working Experience (years)	No. of Respondents	Percentage
1	Between 2 and 4	3	1.9
2	Between 4 and 6	27	17.3
3	Above 6	124	80.8
Total		154	100

Source: Survey Data, 2025

According to the Table 4.6, 1.9% of respondents are between 2 to 4 years, 17.3%of respondents are between 4 to 6 years, and, 80.8%of respondents are above 6 years. According to the results, most respondents have working experience Above 6 years.

4.2 Analysis on Reliability of the Variables

Cronbach's Alpha measured internal consistency to verify questionnaire item validity and reliability. Reliability tests were performed on the variables of income, attitude, financial literacy, product awareness, and customer trust following the collection the survey data. The consistency with which the items in each variable measured the intended concepts was evaluated using Cronbach's Alpha. The findings showed that each reliability coefficient was higher than the suggested minimum value of 0.70, indicating that the survey methods are reliable and appropriately represent the concepts of study.

Table 4.8 shows the reliability test results for each research variable. In this study, income, attitude, financial literacy, product awareness, and customer trust are independent factors, while purchase intention is the dependent variable.

Table 4.8 Results from Reliability

Sr. No.	Factors	No. of Items	Cronbach's Alpha
1	Income	7	0.966
2	Attitude	7	0.964
3	Financial Literacy	7	0.963
4	Product Awareness	6	0.965
5	Customer Trust	7	0.964

Source: Survey Data, 2025

Table 4.8 presents reliability test findings for Income, Attitude, Financial Literacy, Product Awareness, and Customer Trust questionnaire questions. The outcome shows analysis variable consistency and usefulness. All questionnaire items relating to the reliability coefficients exceed 0.7. So, the devices are dependable enough for analysis.

4.3 Descriptive Statistics of the Variables

This study presents demographic factors and data mean and standard deviation using descriptive statistics. Survey means and standard deviations were determined for each Purchase Intention variable

4.3.1 Mean and Standard Deviation of Income Level

The following table provides Income Level mean and SD. Seven workload factor questions are asked using a seven-point Likert scale.

Table 4.9 Mean and Standard Deviation of Income Level

Sr. No.	Items	Mean	Standard Deviation
1	I'm focusing on my expenses now, but buying for life insurance is a future goal.	5.65	1.106
2	I am satisfied with my current income/salary.	5.76	1.043
3	I have a habit of monthly saving.	5.78	.966
4	My income is enough for my monthly Spending.	5.69	1.196

Source: Survey Data, 2025

Table 4.9 Mean and Standard Deviation of Income Level (Continue)

Sr. No.	Items	Mean	Standard Deviation
5	I will most probably buy life insurance if my income is increased.	5.85	0.931
6	My income directly affects my purchasing power.	5.96	0.908
7	I will purchase a life insurance depends on how much I earn.	5.83	0.972
Overall mean		5.78	

Source: Survey Data, 2025

As can be seen in Table 4.9, the mean of Income Level measures ranged between 5.65 and 5.96. The highest mean value was for “My income directly affects my purchasing power.” and the lowest mean value was for “I’m focusing on my expenses now, but buying for life insurance is a future goal”. According to the overall mean value, respondents generally acknowledged that income significantly influences their financial decisions, and they know about the importance of life insurance, they are currently prioritizing short-term financial responsibilities over long-term planning.

4.3.2 Mean and Standard Deviation of Attitude

Mean and standard deviation are shown as follow. Respondents answer seven work condition questions on a seven-point Likert scale.

Table 4.10 Mean and Standard Deviation of Attitude

Sr. No.	Items	Mean	Standard Deviation
1	I think buying life insurance is a necessary option.	5.81	0.991
2	I buy life insurance helps to set up future financial plans.	5.87	0.907
3	I buy life insurance helps to feel secure to work and enjoy life.	5.86	0.953
4	Life insurance is a good tax-saving scheme.	5.87	0.988

Source: Survey Data, 2025

Table 4.10 Mean and Standard Deviation of Attitude (Continue)

Sr. No.	Items	Mean	Standard Deviation
5	I fully understand the life insurance plan.	5.87	1.010
6	I think life insurance best satisfies my financial needs.	5.80	1.086
7	I understand the financial phrases and symbols of life insurance plan.	5.80	0.953
Overall Mean		5.84	

Source: Survey Data, 2025

According to the result, the highest mean score for understanding the life insurance plan is 5.87 and while the lowest mean score for thinking life insurance best satisfies financial needs and understanding the financial phrases and symbols of life insurance plan are 5.80. The overall mean value of attitude is 5.84 and it indicate that the respondents generally know that the clear communication and transparency are effective in building trust but trust in life insurance grows with clarity, but full confidence in its financial suitability often requires personal experience or a deeper connection to individual needs.

4.3.3 Mean and Standard Deviation of Financial Literacy

Financial Literacy means and standard deviation. Seven financial literacy questions are asked on a seven-point Likert scale.

Table 4.11 Mean and Standard Deviation of Financial Literacy

Sr. No.	Items	Mean	Standard Deviation
1	I know about other financial products that might satisfy my financial needs.	5.82	0.967
2	I've learned how to manage my money properly from any institution.(training/course/school/university/ experience, etc.)	5.90	0.886
3	I enjoy discussing with my colleagues/peers about money management issues (taxes, investing, credit cards).	5.84	1.013

Source: Survey Data, 2025

Table 4.11 Mean and Standard Deviation of Financial Literacy (Continue)

Sr. No.	Items	Mean	Standard Deviation
4	Understand the financial phrases and symbols of life insurance policy.	5.76	0.978
5	Enjoy discussing with colleagues/peers about money management issues (taxes, investing, credit cards).	5.81	1.119
6	I understanding related the financial concept of Life Insurance product.	5.81	1.017
7	I have a positive view of traditional life insurance products in relation to financial situations.	5.89	.947
Overall Mean		5.83	

Source: Survey Data, 2025

According to the Table 4.11, the mean score of financial literacy is between 5.76 and 5.90. The highest mean was “I’ve learned how to manage my money properly from any institution. (training/course/school/university/experience, etc.)” is 5.90 and the lowest was “Understand the financial phrases and symbols of life insurance policy” is 5.76. The overall mean score is 5.83 and it indicate that Financial self-efficacy and confidence in handling funds are high among respondents. However, this suggests that financial literacy initiatives should place greater emphasis on clarifying insurance-related terms and language to help individuals apply their knowledge more effectively.

4.3.4 Mean and Standard Deviation of Product Awareness

Product Awareness means and SDs are listed below. Seven product awareness questions are asked using a seven-point Likert scale.

Table 4.12 Mean and Standard Deviation of Product Awareness

Sr. No.	Items	Mean	Standard Deviation
1	I am informing about the product of life insurance company.	5.73	0.999
2	I am aware that having a life insurance policy ensures financial security.	5.81	1.029

Source: Survey Data, 2025

Table 4.12 Mean and Standard Deviation of Product Awareness (Continue)

Sr. No.	Items	Mean	Standard Deviation
3	I am concerned about the financial benefit of having a life insurance policy.	5.75	1.051
4	Product Awareness is one of important factor to sustain business.	5.93	0.965
5	Companies get more market share by providing attractive and unique products.	5.94	0.931
6	I have knowledge about life insurance policy.	5.79	0.997
7	Life insurance will protect family's financial future.	5.89	0.927
Overall Mean		5.83	

Source: Survey Data, 2025

According to the Table 4.12, the mean score of product awareness is between 5.73 and 5.94. The highest mean score was for companies get more market share by providing attractive and unique products is 5.94 and the lowest mean score was for informing about the product of life insurance company is 5.73. The overall mean score is 5.83 it shown that the respondents were strongly agreeing to support for the idea that unique products contribute to increased market share and the moderate level of agreement with the concern about life insurance financial benefits.

4.3.5 Mean and Standard Deviation of Customer Trust

Customer Trust means and standard deviation. Ten security questions are asked on a seven-point Likert scale.

Table 4.13 Mean and Standard Deviation of Customer Trust

Sr. No.	Items	Mean	Standard Deviation
1	I trust life insurance company.	5.81	1.017
2	I stick life insurance company in the near future.	5.77	1.106
3	I have a long business history with life insurance company.	5.63	1.368

Source: Survey Data, 2025

Table 4.13 Mean and Standard Deviation of Customer Trust (Continue)

Sr. No.	Items	Mean	Standard Deviation
4	The companies who underwrite life insurance policies are safe.	5.78	1.115
5	I regularly see or hear advertisements presented by life insurance companies.	5.86	1.000
6	There are positive recommendations for life insurance companies.	5.84	0.960
7	Life insurance provides long-term financial protection for our family.	5.91	0.973
Overall		5.8	

Source: Survey Data, 2025

As shown in Table (4.13), the mean of security ranged between 5.63 and 5.91. The highest mean was for “Life insurance is providing long-term financial protection for our family.” and the lowest mean was for “I have a long business history with Life Insurance Company”. The overall mean score for security is 5.8. According to the mean score most of the respondent are strongly recognize the value of life insurance in securing their family's financial future and slightly less agreement and potentially reflects shorter or less consistent relationships with insurance providers among respondents.

4.3.6 Mean and Standard Deviation of Purchase Intention

Purchase Intention means and SD are shown. Seven purchasing intention items are asked on a seven-point Likert scale.

Table 4.14 Mean and Standard Deviation of Purchase Intention

Sr. No.	Items	Mean	Standard Deviation
1	I know the value of life insurance and want to purchase as soon as possible.	5.81	0.924
2	It is likely that I will actually purchase the premium service in the near future.	5.85	0.949
3	I intended to purchase only saving products.	5.97	0.880

Source: Survey Data, 2025

Table 4.14 Mean and Standard Deviation of Purchase Intention (Continue)

Sr. No.	Items	Mean	Standard Deviation
4	Having intention to buy life insurance product in the near future.	5.96	0.886
5	I intended to purchase both saving products and protection products.	5.83	0.938
6	Purchasing a life insurance plan will provide me future surety which I need the most for my inheritance.	5.90	0.900
7	I will recommend my friends and relatives to purchase life insurance from the same company that I purchased.	5.81	0.924
Overall		5.87	

Source: Survey Data, 2025

According to the table above, the mean of purchase intention of life insurance policy measure range between 5.81 and 5.97. The highest mean was for “I intended to purchased only saving products” and the lowest mean was for “I know the value of life insurance and want to purchase as soon as possible”. There is a significant interest and evident intention to purchase life insurance, especially for its savings benefits; yet, however, there continues to be opportunity to increase urgency or quick action among potential buyers. The overall mean vale of purchase intention is 5.87 and it indicate that most of the respondents are strong desire and intention to acquire life insurance, notably for its savings benefits, but potential purchasers may act more quickly.

4.4 The Correlation Analysis of Variables

A Pearson Correlation study examined if income, attitude, financial literacy, product awareness, and customer trust linearly affected purchase intention.

4.4.1 Correlation Analysis for Income, Attitude, Financial Literacy, Product Awareness and Customer Trust.

Table 4.15 Correlation Analysis of the Study

Sr. No.	Independent Variables	Pearson Correlation Coefficient	Sig (2-tailed)
1	Income	0.842**	0.000
2	Attitude	0.846**	0.000
3	Financial Literacy	0.832**	0.000
4	Product Awareness	0.817**	0.000
5	Customer Trust	0.862**	0.000

Source: Survey Data, 2025

** Correlation is significant at the 0.01 level (2-tailed).

Table 4.15 demonstrates a 0.842 income-purchasing intention relationship at 1% significance. An 0.846-1% association exists between attitude and purchase intention. Financial literacy and buying intention correlate 0.832 at 1% significance. Significant association between product awareness and purchase intention is 0.817 at 1%. Purchase intention and customer trust are connected with 0.709 at 1% significance. Pearson correlation coefficient shows that income, attitude, financial literacy, product awareness, and consumer trust positively affect life insurance purchase intention.

4.5 Multiple Regression Analysis

Multiple regression was used to determine purchase intention's most influential elements. The multiple regression model utilized purchase intention as the dependent variable and income, attitude, financial literacy, product awareness, and customer trust as independent variables.

4.5.1 Multiple Regression Analysis on Income, Attitude, Financial Literacy, Product Awareness and Customer Trust

Table 4.16 Multiple Regression Analysis of the Study

Dependent Variable	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	VIF
	b	Std. Error	B			
(Constant)	0.486	0.234		2.072	0.040	
Income Level	0.291***	0.077	0.284	3.807	0.000	4.392
Attitude	0.250***	0.081	0.257	3.100	0.002	5.452
Financial Literacy	0.046	0.091	0.047	0.507	0.613	6.905
Product Awareness	0.059	0.091	0.055	0.647	0.519	5.820
Customer Trust	0.275***	0.076	0.313	3.632	0.000	5.881
R ²	0.811					
Adjusted R ²	0.804					
F-value	128.394***					

Source: Survey Data, 2025

*** indicates statistical significance at the 1% level.

According to Table (4.16), regression analysis is conducted with purchase intention and the independent variables. From the coefficient table, the explanatory variables include in this study were not significantly suspected to multi co-linearity problem because all of the VIF values are less than 10. It is shown that the independent variables: income, attitude and customer trust are making a significant unique contribution to the prediction of buying life insurance product $p=0.000$ ($p<0.01$). The adjusted R square is 0.804 that reveals 80.4% of total variance in purchase intention is explained by variation in independent variables. Result shows that F value is 128.394 that is significant at $p=0.000$ (>0.01).

The value of regression coefficient between income and purchase intention is 0.284 ($t = 3.807$, $p = 0.000$). This shows that there is a positive relationship between

income level and purchase intention at 1% level significant. The value of regression coefficient between attitude and purchase intention is 0.257 ($t = 3.100$, $p = 0.002$). This shows that there is a positive relationship between attitude and purchase intention 1% level significant. The value of regression coefficient between financial literacy and purchase intention is 0.047 ($t = 0.507$, $p = 0.613$). This shows that there is a positive relationship between financial literacy and purchase intention but it is not significant. The value of regression coefficient between product awareness and purchase intention is 0.055 ($t = 0.674$, $p = 0.519$). This shows that there is a positive relationship between product awareness and purchase intention but it is not significant. The value of regression coefficient between customer trust and purchase intention is 0.313 ($t = 3.632$, $p = 0.000$). This shows that there is a positive relationship between customer trust and purchase intention at 1% level significant.

According to the above results, income level, attitude and customer trust are significantly associated with purchase intention. Financial literacy and customer trust are positively relation but no significant. Among them, customer trust is the most influential independent variables on purchase intention. Whatever, financial literacy and product awareness are not significantly associated with purchase intention of life insurance. Therefore, life insurance providers can foster and increase purchase intention through benefit, ease of use and security.

The result of assumptions by the multiple linear regression model were checked, and the results were shown in Appendix B. According to the result of histogram reveals that the residuals are bell-shaped and follow the normal curve, peaking around zero. A Normal P-P Plot compares observed cumulative probabilities to those predicted if the data were completely normally distributed. The study also assumes homoscedasticity, which means residual variance is stable across independent variable levels. For homoscedasticity, the points on this scatterplot should be randomly distributed around zero, with no discernible pattern. In this study, the VIF value of all independent variables are less than 10. This result indicates that there is no multicollinearity problem in this study.

4.6 Achieving of Hypothesis Testing

Multiple regression analysis shows that income level, attitude, financial literacy, product awareness, and customer trust significantly affect life insurance

policy purchase intentions among MBA students at University of Co-operative and Management, Sagaing.

H₁ is accepted. A significant effect occurs in the linkage between income level and purchase intention of life insurance policy. Thus, hypothesis H₁: income level has a positive effect on and purchase intention of life insurance policy, is accepted. As a result, respondents may feel higher incomes are more inclined to provide buying a life insurance policy a second thought.

H₂ is accepted. A significant correlation appears between attitude and life insurance policy purchase intention. The result show that life insurance buyers like it. Positive views of life insurance as a financial safety net or a responsible investment for their family may increase their willingness to buy.

H₃ is rejected. Life insurance policy purchase intention is not substantially impacted by financial knowledge. Life insurance purchases seem unaffected by financial understanding. Emotions, insurer trust, and necessity may influence buying intent more.

H₄ is rejected. There is no significant impact of product awareness on life insurance policy purchase intention. Thus, the data implies that knowing about life insurance choices does not significantly affect respondents' likelihood of buying them. Awareness may not be enough to encourage policy purchases; people may require a deeper understanding, emotional motivation, perceived worth, or confidence in the provider.

H₅ is accepted. Customer trust significantly impacts life insurance policy purchasing intention. The research shows that clients who trust insurance firms and see them as reliable, open, and devoted are more likely to acquire life insurance.

CHAPTER V

CONCLUSION

Finding and discussion, suggestions and recommendations, study implications, and future research were the key topics of this chapter. This chapter mainly focused on findings and discussion, suggestions and recommendations, implications of the study and needs for further study.

5.1 Findings and Discussions

This study aimed to explore life insurance purchase intention factors. This study has two major goals: to identify the key factors affecting MBA students' purchasing intentions and to explore the link between factors and intents. This study uses primary and secondary data to achieve its goal. This online poll received primary data from 154 respondents. Secondary data comes from books, websites, and research papers. Part A is a respondent's demographic data, Part B is the elements influencing by intention, and Part C focuses life insurance purchase intention

Demographic data analysis shows that most of the respondents are middle-aged women. Most respondents have bachelor's degrees. Their salary is enough. The investigation of MBA students' life insurance policy purchase intentions at University of Co-operative and Management, Sagaing yielded the following results. Most respondents strongly agree that income level influences life insurance policy purchasing intention. In this survey, respondents want life insurance but have trouble affording it. The organization should provide several packages for different income levels. Life insurance purchasing intention is strongly influenced by respondents' attitudes. According to respondents, life insurance is essential for financial security and long-term planning. Insurance firms should solve customer service issues to retain their reputation and service standards. Financial knowledge affects life insurance purchase intention, according to respondents. Respondents realize financial items may benefit them.

They prefer talking about taxes and investing. Thus, companies should promote financial literacy and seek consumer loyalty. According to the poll, product awareness affects purchasing intention. It can help people appreciate themselves and make confident choices. Life insurance plans that secure their families' financial

futures attract respondents. Offering beautiful and distinctive products may boost consumer interest and help life insurance firms succeed. Most respondents strongly believe that customer trust is most important for life insurance policy purchasing intention. This is crucial for long-term company success. Respondents like life insurance firms, and good recommendations enhance client trust. Life insurance is a critical product that protects families financially for the future.

As a finding of in this study, income level is a most efficient factors of purchase intention. The second effectiveness factor is customer trust and the third one is attitude. Most of the respondents have to buy life insurance and they are also known for its long-term financial benefits. Therefore, life insurance companies should be providing by strong service, reputation, and positive recommendations are essential for long-term business success in the insurance industry.

5.2 Suggestions and Recommendations

As a result of finding, income, attitude and customer trust are positive relationship and significant effect on purchase intention. These independent variables are evaluated while buying life insurance. However, financial literacy and product awareness do not affect life insurance purchases. Insurance businesses should carefully analyze consumers' buying behavior, attitude, cultural, personal, and psychological characteristics, since these variables influence customers' insurance product purchases.

According to the survey, product awareness of life insurance policy and a clearly understanding of its policies, returns, and benefits are crucial for engaging potential policyholders. Before agents attempt to provide insurance products, buyers need to be knowledgeable about insurance concepts. Consumers frequently use mobile phones and internet technology to carry out social media research on life insurance policies before making a purchase. They also seek insurance agents for direction, who help them make well-informed judgments and customize products according to the customer's most urgent requirements. Therefore, the ability of agents to develop trusting connections with consumers is one of the most significant social factors in the insurance sector. This emphasizes how crucial it is for agents to inform customers and suggest insurance policies that best fulfill their requirements.

By increasing awareness about life insurance, individuals gain access to suitable insurance products that help reduce financial risks. Consumers can get

suitable insurance ideas that reduce financial risks by becoming more knowledgeable about life insurance. Making informed decisions regarding financial products and services also requires financial literacy. Insurance companies are essential in providing social and financial security because they are financial service providers. Insurance providers need to be aware of their customers' risk attitudes, emotional worries, and opinions of insurance companies in order to serve them well. Additionally, using several kinds of systems, like social media advertising, personal selling, sales promotions, and collaborations with event organizers for the distribution of policy information, insurers and agents actively try to increase awareness of knowledge about insurance. Furthermore, being financially literate is essential for making knowledgeable decisions regarding financial products and services. Trust is a critical factor in insurance purchase decisions. Insurance companies should ensure clear communication of policy terms, fair claim processes, and responsive customer service. Investing in agent training and digital tools to enhance service quality can foster long-term trust. Therefore, insurance companies must increase awareness of policies and provide financial education.

When choosing to get a life insurance policy, attitude is an important consideration. Customers evaluate the return on their investments between a life insurance policy and bank savings based on their current attitudes regarding life insurance. An additional problem is that because of Myanmar's price inflation, people are not interested in purchasing life insurance. Customers are more likely to buy life insurance product after facing with natural disasters such as earthquakes, floods, and hurricanes. They are more knowledgeable of the risks they face and financial risk. These occurrences become a turning point, their families' safety and their financial future. Since they perceive life insurance as an essential tool for risk management and providing long-term financial security, consumers are becoming more accepting of purchasing it. Therefore, in order to influence consumers to develop positive feelings about life insurance products and to promote purchasing motivations, marketers have to find out how they can understand attitudes.

According to the result, income level is a most significant factors of influencing the decision to purchase life insurance. It is recommended that insurance companies develop targeted their product offerings based on consumers' income segments to improve consumer reach and market presence. Life insurance products can help reduce financial risk and increase insurance awareness, especially in

underserved communities. For consumers with regular or higher income, insurers should focus on life insurance products that combine savings and protection elements, aligning with their long-term financial planning goals. By understanding and addressing the diverse financial capacities of potential policyholders, insurance companies in Myanmar can gain a competitive advantage and contribute significantly to the development and success of the national insurance industry.

This study has identified several key factors influencing like income, attitude, financial literacy, product awareness and customer trust. All of the variable are positively relationship between purchase intentions of life insurance policy. Among the independent variables analyzed, income level, attitude and customer trust are showed a significant and positive relationship with life insurance purchasing decisions, indicating that consumers' financial capacity plays a crucial role in their willingness to invest in insurance. In conclusion, Life Insurance Company, agents, and managers are must to know their target customers behavior, Trust and attitude to buy their financial product.

If organizations are clear understanding the factors influencing of customer's buying behavior, they can support the growth of consumer purchasing power, modify insurance plans according to individual consumer needs. Additionally, more people purchasing life insurance results in increased annual income, which can help the economy of the country, grow.

5.3 Implications of the Study

This study examines how income, attitude, financial literacy, product awareness, and customer trust affect MBA students' purchase intention at UCMS. Income, attitude, and customer trust favorably affect by intention, whereas financial literacy and product awareness are insignificant in this study. These findings show that life insurance attitudes, financial capabilities, and insurance company trust strongly affect client purchases. This implies that insurance businesses should focus on nurturing client connections through personalized care and assistance. The study additionally provides insurance businesses in Myanmar useful information, especially how to develop specific offerings those satisfy the needs for various customer groups and income levels. This study indicates that the insurance sector, trust is essential for both long-term customer loyalty and making sound decisions.

5.4 Needs for Further Study

The scope and limitations of this study focus on life insurance policy buying intentions. This only collects questionnaires from UCMS MBA students (1st and 2nd batches). The study solely includes MBA students, limiting time frame effects. Further research suggested collecting data on different populations. Future studies should also examine specialized insurance products including education, fire, health, and natural catastrophe insurance to understand insurance customer behavior. Further research should study psychological, cultural, and personal elements that influence customer buying decisions. In addition, future research should investigate a broader range of influencing factors that shape insurance buying behavior. Psychological factors such as risk perception, trust in insurance providers, financial anxiety, and attitudes toward future planning play a critical role in decision-making. Cultural influences, including societal norms, religious beliefs, and the role of family in financial decisions, also significantly impact consumer behavior. Marketing and communication strategies particularly the effectiveness of promotional campaigns, the clarity of insurance policy terms, and the growing influence of digital media also affect purchasing intentions.
